

How to use Ketamine with a Nebulizer

for Treating Major Depression

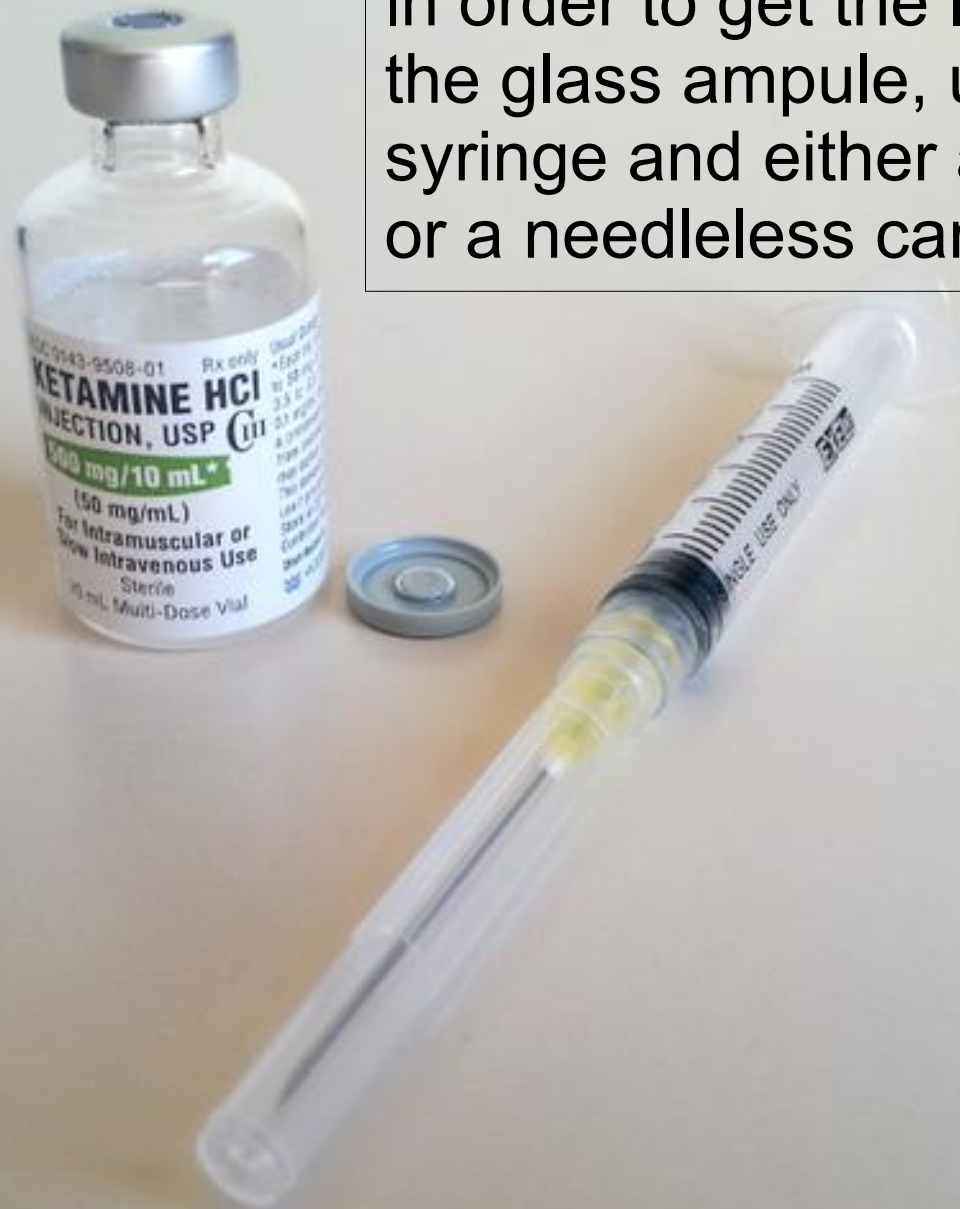

NebKet

Use one volume of 50 mg/ml concentration per 50-min session.

Much of the vapor is expelled to the room and thus not inhaled.

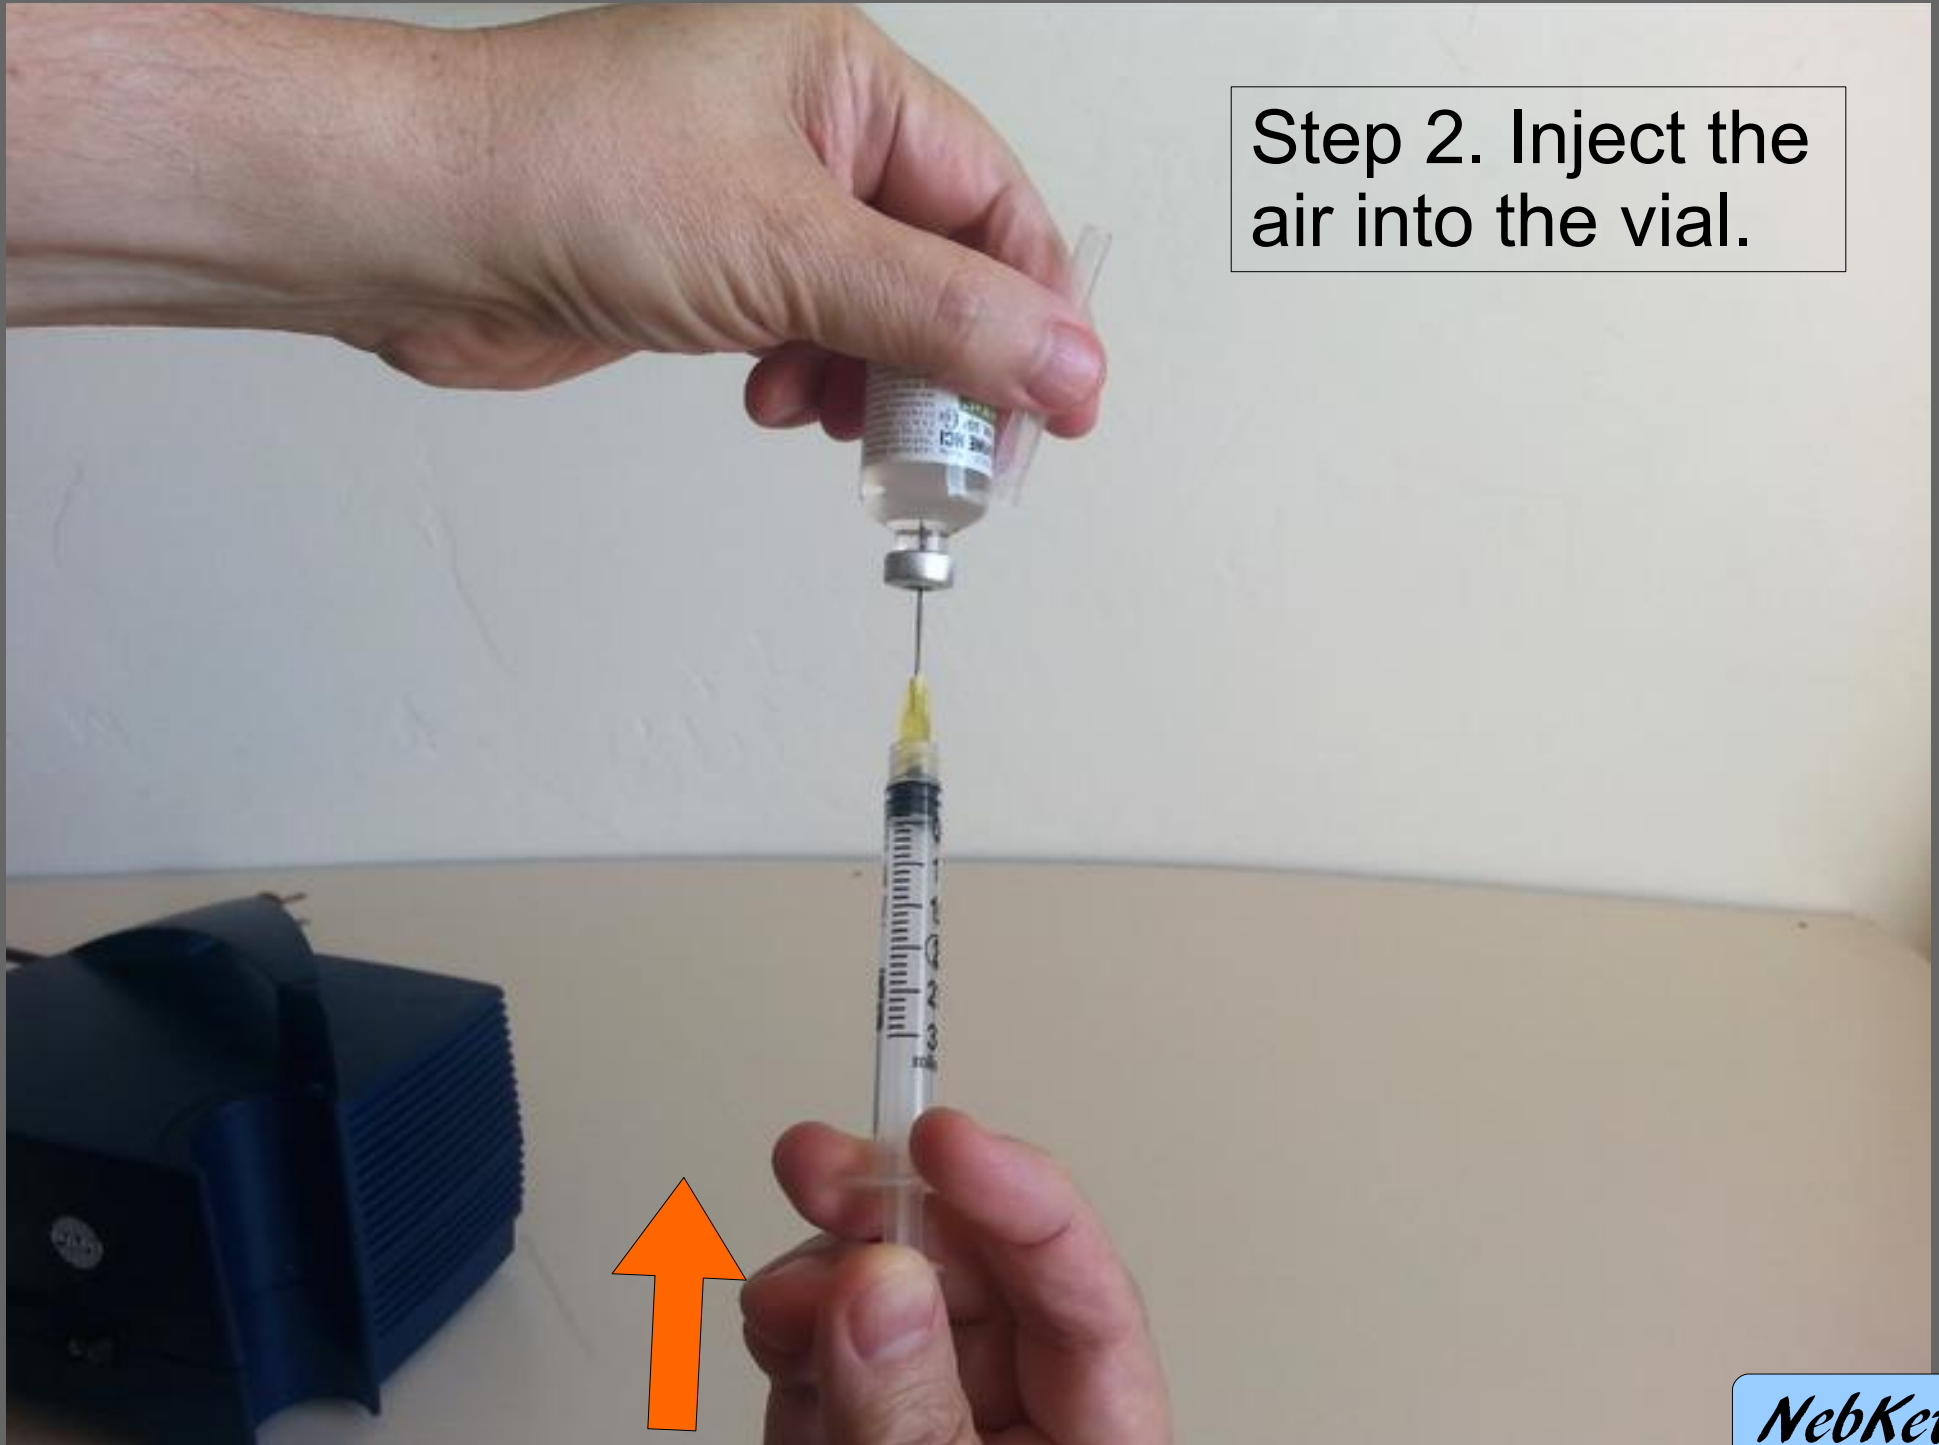

In order to get the liquid out the glass ampule, use a syringe and either a needle or a needleless cannula.

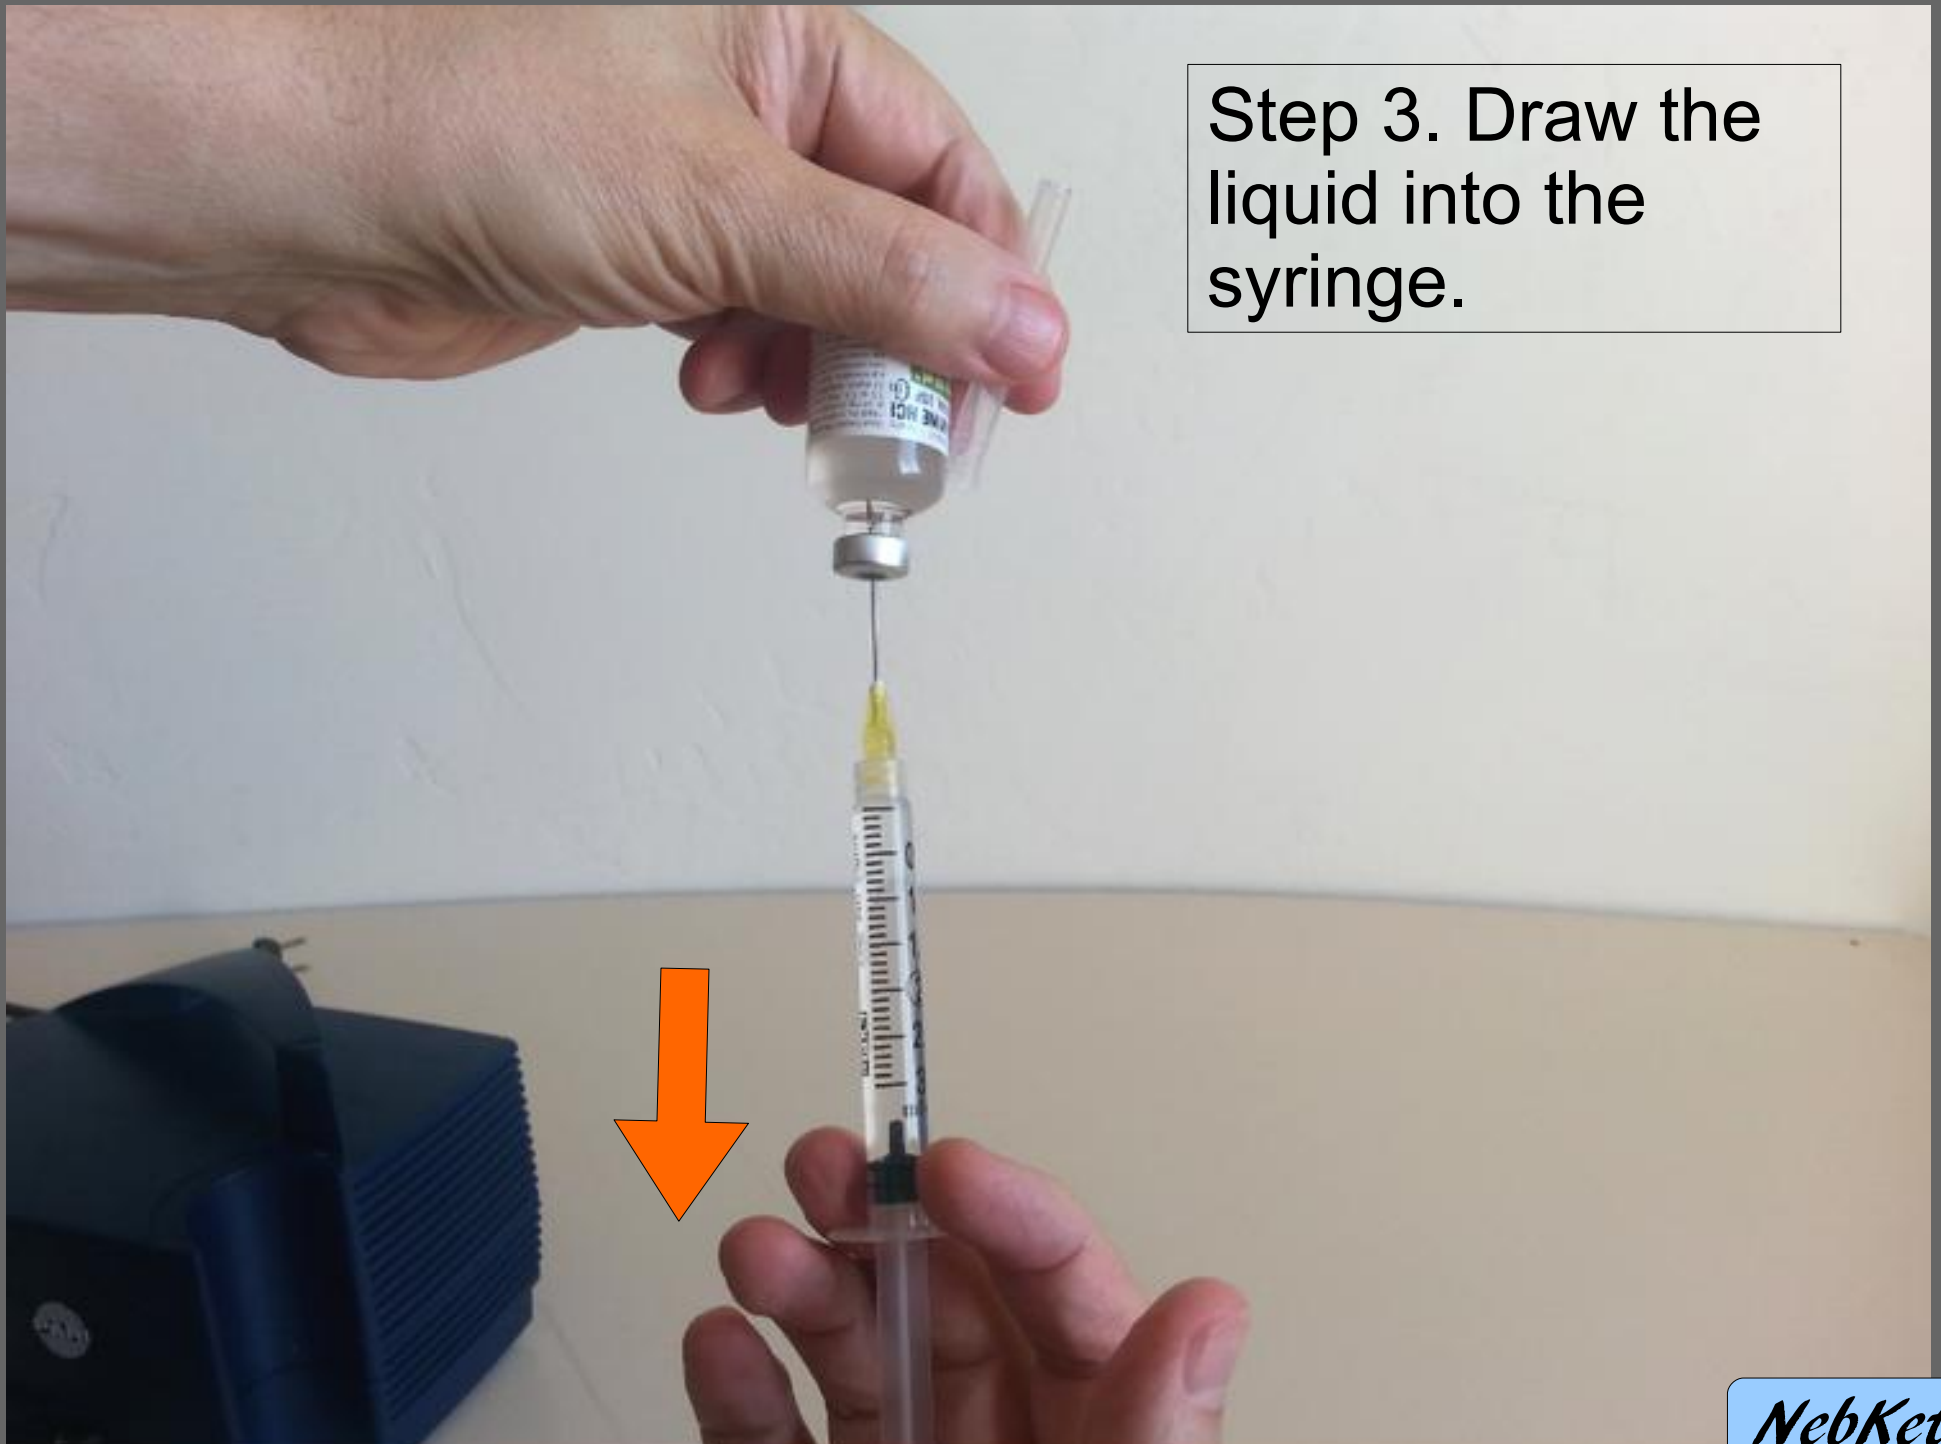

Step 1. Fill the syringe with air.

Step 2. Inject the air into the vial.

Step 3. Draw the liquid into the syringe.

Step 4. Inject the liquid into the nebulizer compartment.

Step 5. Put the mask on your face and turn the device on.

Patients can simply pull the mask off or turn the switch off on the device if the effect feels too strong.

The session will automatically end in ~50mins when the medicine runs out.
